

# Vestiaire Collective

## My Vestiaire Weather

---

### Objectives

Develop a native application containing **at least** the following elements :

- A list view displaying 16 days weather forecast for Paris
- A detail view displaying a maximum of informations for a specific day's weather
- On the detail view, display "Hot" if temperature is  $> 25^{\circ}\text{C}$ , "Cold" if temperature  $< 10^{\circ}\text{C}$

What you need to focus on :

- Choice of architecture. We use MVVM here at Vestiaire but you are free to implement a different architecture as long as you can justify why
- Unit Tests implementation
- Justify any dependencies that you might use
- Code quality and code conventions
- Code must be written in Swift, target must be iOS 11.0
- We will actually read your code, don't hesitate to put comments if you think it's necessary

Nice to have :

- Once weather datas have been downloaded, user can access it offline
- Any addition that you can think of (feature/design/etc.)

The use of external dependencies is authorized, but you will have to justify the use for each of them.

This test has no limit of time.

### Additional informations

Open Weather API KEY : **648a3aac37935e5b45e09727df728ac2**
